**Erectile dysfunction and male incontinence**

**Life after prostate cancer**

End your frustration. Restore your normalcy. Renew your confidence.
Life after prostate cancer

Beating prostate cancer is a patient’s top priority. Living with the potential long-term side effects of incontinence and erectile dysfunction can be an ongoing concern. In order to remove the cancer, the mechanisms in your body that help control urine flow and the ability to get an erection may be damaged.

Most men regain continence and erectile function over time. For those who do not fully regain their continence or erectile function, there are options available to restore normalcy.

The quotes featured throughout this brochure are from real men who have found satisfying solutions for their incontinence and erectile dysfunction after prostate cancer. Their testimony is based on their own experience, and may not be typical for all patients.

The good news is that there are treatment options that can help.
Fix your incontinence

While men often experience stress urinary incontinence (leaking of urine) immediately following prostate cancer treatment, the leakage usually resolves within weeks or several months.\(^1\) When bladder leakage persists beyond several months, you should consult your doctor. Long-term treatment options include the AdVance™ Male Sling System and the AMS 800™ Urinary Control System (AUS).

The AUS has been the gold standard treatment for male bladder leakage for more than 40 years and over 180,000 have been implanted worldwide.\(^2\)

The AdVance™ Male Sling System is a small sling made of soft mesh implanted inside the body to reposition the urethra and provide support to surrounding muscles. This can help to keep the urethra closed, especially when coughing, sneezing and lifting.

SATISFYING RESULTS

94% would recommend the AdVance Sling procedure to a friend.\(^3\)

The AMS 800™ Urinary Control System is placed inside the body. A saline-filled cuff keeps the urethra closed and a pump in the scrotum allows urination on demand.

SATISFYING RESULTS

90% of patients reported satisfaction with their AMS 800 System and would undergo the procedure again.\(^4\)

“I never left the house without half a dozen pads. Once I got the AUS, it was fabulous! I consider myself continent now.”

- Mike, prostate cancer survivor
Find your best ED cure

Erectile dysfunction (ED) is known to be a potential complication following surgical and non-surgical prostate cancer treatments. With nerve-sparing procedures, some men may regain their previous level of erectile function, although it may take up to a year. The journey is different for every man, and some may not recover their ability to have a natural erection. However, it is important to know that there are both short-term and long-term solutions that can be effective in treating ED.

Know all your options — there is hope for nearly every man living with ED. You don’t have to suffer in silence. Treatment options include oral medications, vacuum devices, suppositories, injections and penile implants. These treatments work differently for different people, and some may be more effective than others for you.

92% of patients and 96% of their partners were satisfied with the AMS 700™ Penile Implant

25–75% of men experience ED after prostate cancer treatment.

An AMS 700 Implant is a unique solution because it allows you to be intimate wherever, whenever and for as long as you want. It lets you be spontaneous again, and is reliable with no medication side effects or ongoing costs. Many patients and partners are highly satisfied with the penile implant. Penile implants have been in clinical use for over 40 years and nearly 500,000 patients have been treated with an AMS Men’s Health penile implant.
Take control and get your life back

Finding a satisfying treatment for ED and incontinence can be a life-changing event for many men (and their partners) who may have struggled for years with either or both of these conditions; ED or incontinence can impact your self-esteem and affect your most intimate relationships.

Incontinence can leave you feeling isolated and embarrassed, and keep you from doing the things you enjoy for fear of accidental leakage. But you don’t have to live with it.

The AdVance™ Male Sling System is designed to restore bladder control in men with mild to moderate leakage. For more severe, constant leakage, the AUS is the gold standard treatment for restoring bladder control.2

“Prostate cancer surgery left me both incontinent and with ED. After having the AUS surgery, I could go places again and do things socially without risk of embarrassment. Now that I didn’t have the incontinence problem anymore, I was ready to deal with the ED. When I had the penile implant, I felt completely whole again. It has restored my confidence, restored my life.”

- Jerry, prostate cancer survivor

If you are suffering from persistent ED, an AMS Men’s Health penile implant may be the satisfying answer you seek. It is entirely contained inside the body, and provides the ability to have an erection whenever you want and for as long as you want.

The AMS 700™ Penile Implant provides:

• Excellent rigidity
• Natural flaccidity
• Cylinders that expand in length (LGX)
• Cylinders that expand in girth (LGX & CX)
AdVance™ Male Sling System

**Caution:** Federal (U.S.) law restricts this device to sale by or on the order of a physician.

**Caution:** The law restricts these devices to sale by or on the order of a physician.

Your doctor is your best source for information on the risks and benefits of the AdVance™ Male Sling System. Talk to your doctor for a complete listing of risks, warnings and important safety information.

The AdVance™ Male Sling System is intended for the treatment of male stress urinary incontinence (SUI). Potential risks may include inability to urinate (urinary retention), return to incontinence and pain.

AMS 800™ Urinary Control System

**Caution:** Federal (U.S.) law restricts this device to sale by or on the order of a physician.

**Caution:** The law restricts these devices to sale by or on the order of a physician.

Your doctor is your best source for information on the risks and benefits of the AMS 800™ Urinary Control System. Talk to your doctor for a complete listing of risks, warnings and important safety information.

The AMS 800™ Urinary Control System is intended for use in the treatment of male stress urinary incontinence (intrinsic sphincter deficiency) following prostate surgery.

Men with diabetes, spinal cord injuries or skin infections may have an increased risk of infection. Some AMS 800 devices contain an antibiotic (InhibiZone™ Antibiotic Surface Treatment). The device may not be suited for patients who are allergic to the antibiotics contained within the device (rifampin, minocycline or other tetracyclines) or have systemic lupus.

Potential risks may include: device malfunction/failure leading to additional surgery, device migration potentially leading to exposure through the tissue, wearing away/loss of tissue (device/tissue erosion) infection, unintended-inflation of the device and pain/soreness.

AMS 700™ Series Inflatable Penile Prosthesis

**Caution:** Federal (U.S.) law restricts this device to sale by or on the order of a physician.

Your doctor is your best source for information on the risks and benefits of the AMS 700™ with MS Pump™ Inflatable Penile Prosthesis. Talk to your doctor for a complete listing of risks, warnings and important safety information.

The AMS 700™ with MS Pump™ Inflatable Penile Prosthesis is intended for use in the treatment of male erectile dysfunction (impotence). Implanting a penile prosthesis will damage or destroy any remaining ability to have a natural erection, as well as make other treatment options impossible.

Men with diabetes, spinal cord injuries or skin infections may have an increased risk of infection. Implantation may result in penile shortening, curvature or scarring. Some AMS 700 devices contain an antibiotic (InhibiZone™ Antibiotic Surface Treatment). The device may not be suited for patients who are allergic to the antibiotics contained within the device (rifampin, minocycline or other tetracyclines) or have systemic lupus.

Potential risks may include: device malfunction/failure leading to additional surgery, device migration potentially leading to exposure through the tissue, wearing away/loss of tissue (device/tissue erosion) infection, unintended-inflation of the device and pain/soreness.
